Overview

IT lifecycle management is considering business needs, budget and timing to acquire, use and phase out various technologies with thought and intent. A good IT lifecycle always begins with planning. It's important to take into account how this technology will be used and how much it will cost. Organisations should have an idea when it will outlive its use to them so that they can proactively start the planning step for its replacement.

Client Problem / Need

When any company purchase any kind of technology, there is assumption that it will reach a point when it is no longer useful. The technology may become obsolete; that is, it's still functional, but it's too costly to maintain or too slow, or otherwise does not meet your needs. Technology can also break, of course. It's definitely not useful then.

Waiting to replace technology in the workplace until it absolutely breaks may seem financially prudent, however, continuing to use obsolete technology well past its prime usually actually costs more money in the long run

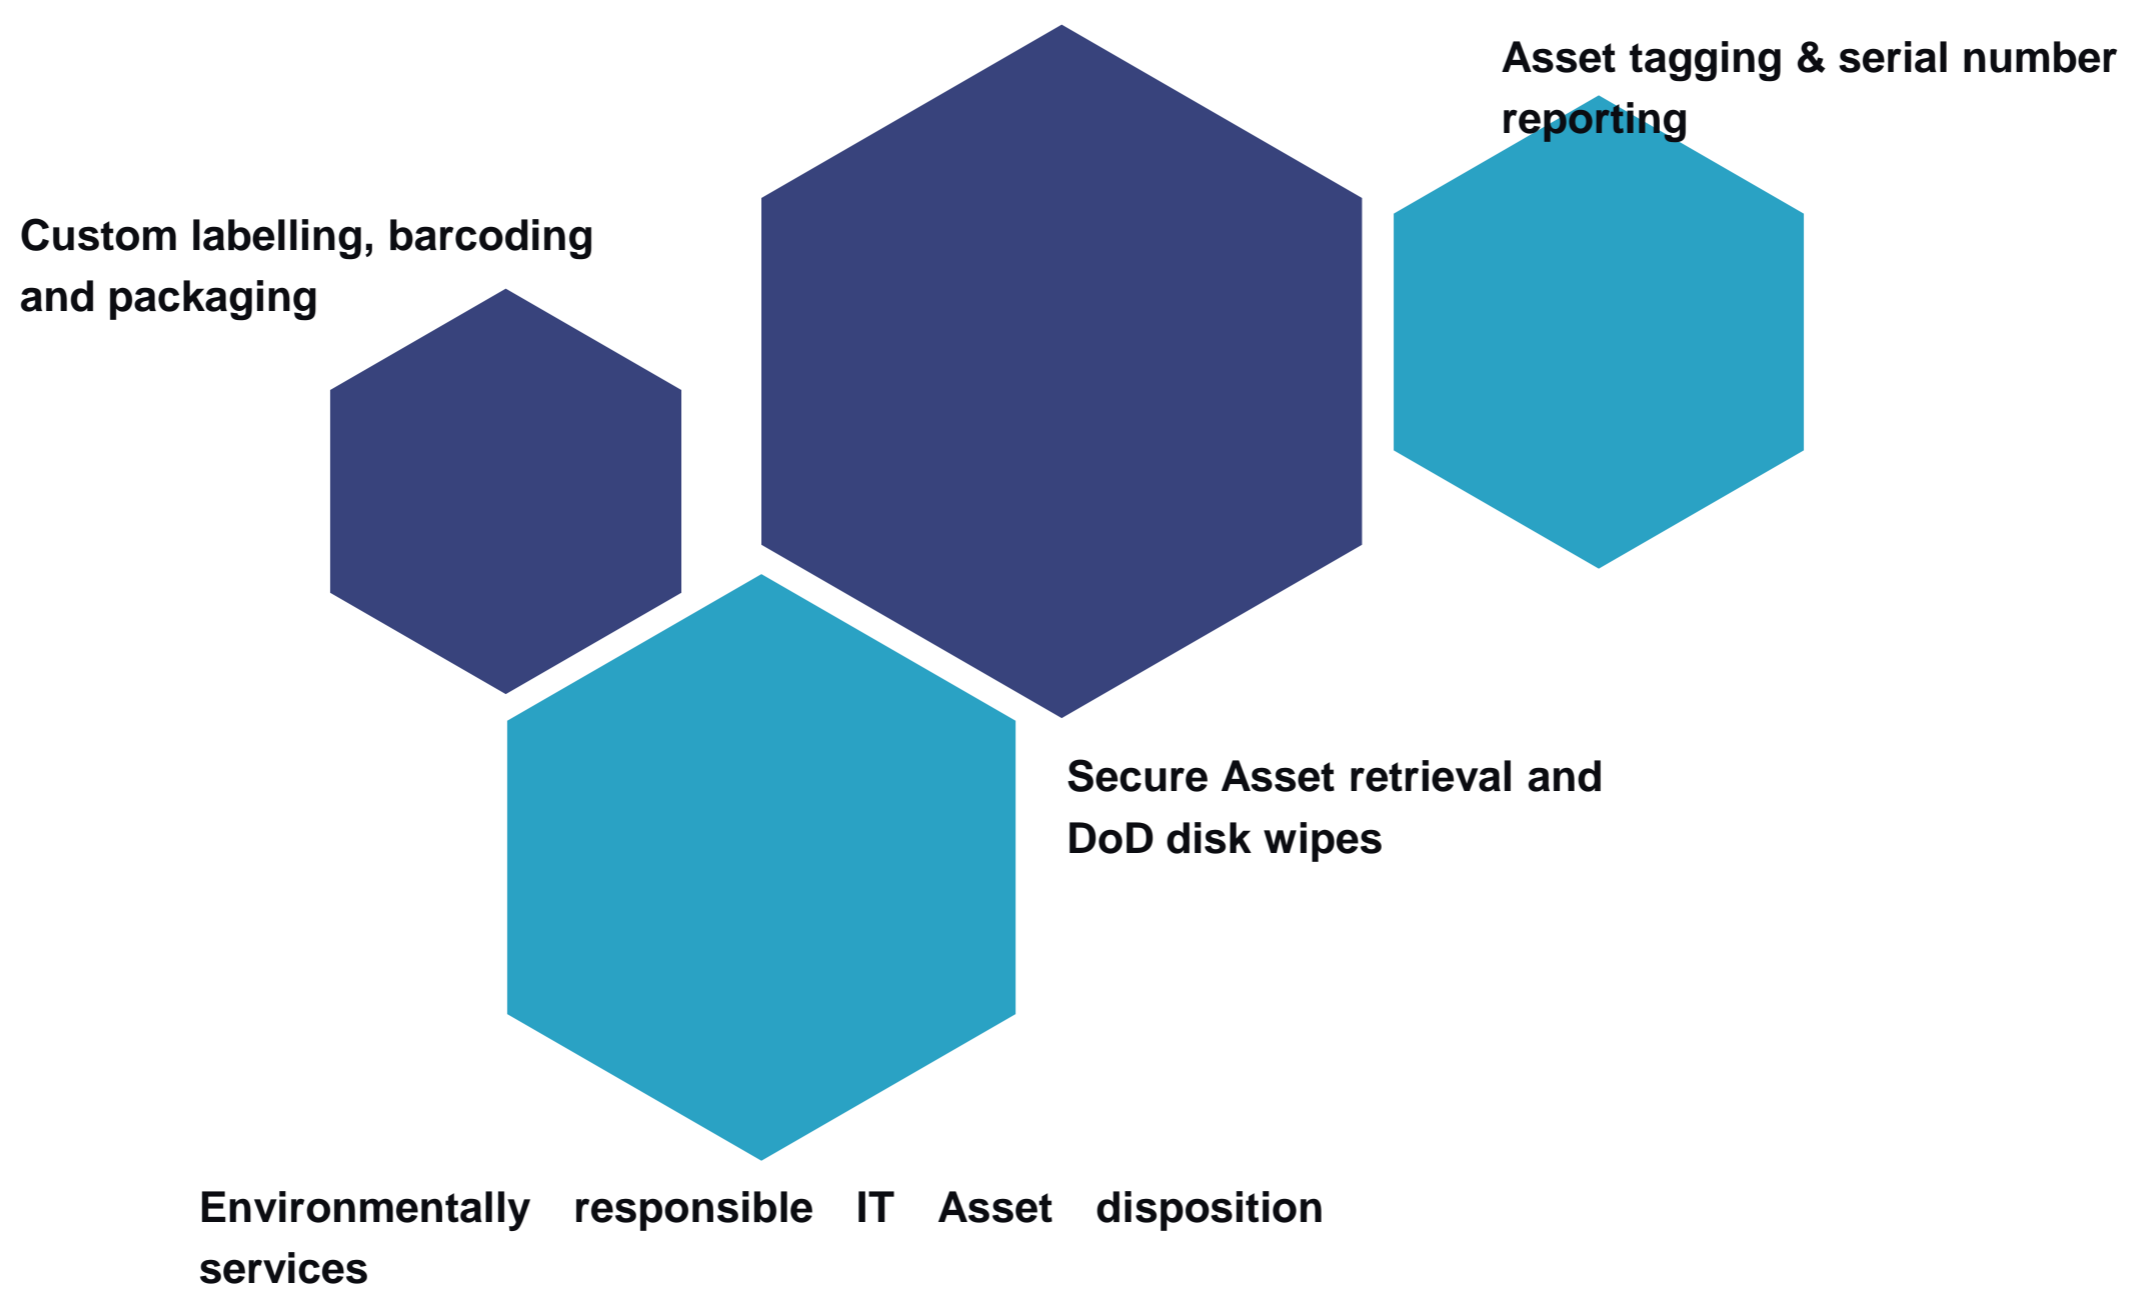

Why Zones

Zones delivers complex IT solutions: Simply. But our solutions don't end at the point of sale. Zones services span the entire IT Lifecycle.
